                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a specifically claimed example of a novel peptide, which is immunogenic with lymphocytes directed against metastatic melanomas. It is characterised in that it comprises at least a part of the following sequence, where the amino acid at position 2 or 8 is substituted: Lys-Thr-Trp-Gly-Gln-Tyr-Trp-Gln-Val. Vaccines comprising the peptide, an epitope of the peptide, nucleotide sequence encoding the peptide, or an antigen presenting cell preloaded with the peptide or antibody as above, are useful for cancer, particularly melanoma, treatment. The peptides can also be used to generate antigen reactive reatment. The peptides can also be used to generate antigen reactive cumour infiltrating lymphocytes, which can also be used in vaccines. The peptides can be exploited to elicit native epitope-reactive CTL. Usage of the peptides with improved immunogenicity may contribute to the development of CTL-epitope based vaccines in viral disease and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MHC; major histocompatability complex; human; cytostatic; anti-HIV; antiinflammatory; dermatological; antiasthmatic; antidiabetic; virucide antiarteriosclerotic; antiulcer; antirheumatic; antiarthritic; AIDS; antipsoriatic; immunosuppressive; inflammatory bowel disease; measles; Crohn's disease; ulcerative colitis; sclerosis; type I diabetes; pox; rheumatoid arthritis; psoriasis; atopic dermatitis; asthma; chicken pox malignant melanoma; carcinoma; cancer; leukaemia; lymphoma; hepatitis;
                                  New Major Histocompatibility Complex (MHC) molecule construct, for treating, preventing, stabilizing or alleviating a disease involving MHC recognizing cells e.g., cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antiarteriosclerotic, antiulcer, antirheumatic, antiarthritic, antiarteriosclerotic, antiulcer, antirheumatic, antiarthritic, antiarteriosclerotic, antiporessive activities and may be used in gene therapy. The MHC molecule construct is useful as a therapeutic composition in vivo or ex vivo therapy, for treating, preventing, stabilising or alleviating a disease involving MHC recognising cells, for monitoring MHC recognising cells or establishing a prognosis of a disease or diagnosing a disease, or determining the status of a disease or the effectiveness of a medicament against a disease, involving MHC recognising cells, e.g., chronic inflammatory bowel disease such as crohn's disease or ulcerative colities, sclerosis, type I diabetes, rheumatoid arthritis, psoriasis, atopic dermatitis, asthma, malignant melanoma, renal carcinoma, breast cancer, lung cancer, cancer of the uterus, cervical cancer, prostate cancer, brain cancer, head and neck
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a new Major Histocompatibility Complex (MHC) molecule construct comprising a carrier molecule to which one or more MHC molecules are attached either directly or via one or more entities. The construct of the invention may have cycostatic, antiinflammatory, dermatological, antiasthmatic, antidiabetic, anti-HIV, virucide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                 Melanoma associated antigen gp100\, - used in vaccines and for detection of tumours
                                                                                                                                                                                                                                                                                                                                                           21-DEC-1994;
16-FEB-1994;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Melanoma; antigen; vaccine; immunogen; primer; probe; detection; identification; tumour; gp100.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunogenic peptide of melanoma associated antigen gp100

The MHC molecule construct is also useful for flow cytometry, histology or cytology. The present sequence represents a peptide used to create the MHC molecule construct of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 1; Page 159; 304pp; English.

                                                                                                              The peptide epitope AAW77119-W77138 were created for human tumour specific cytotoxic T lymphocyte response. These peptides are are cysteine- depleted mutants of a native disease-specific CTL epitope. The cysteine- depleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a disease-specific immunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunogenic peptides derived from the melanoma associated antigen (See AR78639-45) may be used in the production of vaccines. Nucleotide sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be cultured ex vivo and returned to melanoma associated, and when radiolabelled, they may be used to identify
                                                                                                                                                                                                                                                                                                                                                                                                              29-JAN-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                which are closed circles) or circular plasmid DNA (at least 50% of which are supercoiled). Also described is a MP of at most 20 microns in chief control sequence operatively linked to a coding sequence, where the coding sequence encodes an expression product selected from: (1) a coding sequence of: (1) a fragment of a naturally-occurring mammalian crotein; or (ii) a fragment of a naturally-occurring protein from an infectious agent which infects a mammal; (2) a peptide having a length can sequence which permits it to bind to an MHC class I or II molecule; and (3) the polypeptide or the peptide linked to a trafficking sequence. AAM69763 to AAW69765, and AAW78793 to AAW78897 are peptide fragments for the delivery of polymuclectides into phagocytic cells. They can be used for gene therapy, e.g. for treating genetic diseases, infections or to downregulating an immune response.

The peptides are used to exemplify the method CC of invention of producing antigen-specific cytotoxic T cells (CTLs) in CC vitro. The method comprises contacting immunogenic peptides from an CC antigen that binds class I major histocompatibility complex (MHC) CC molecules with antigen presenting cells (APCs) pretreated with CC pretreatment growth factors, and incubating the APCs with purified CD8 CC cells in the presence of at least 2 incubating treatment factors, thereby producing antigen-specific CTLs. A method for specifically killing CC target cells in a human patient is also provided which comprises CC obtaining a fluid sample containing CTLs from a patient, contacting the CC staining a fluid sample containing CTLs from a patient, contacting the CC obtaining a fluid sample containing CTLs from a patient growth CC activated CTLs which are contacted with pre-treatment growth CC activated CTLs which are contacted with a carrier to form a composition. CC The composition can then be administered to the patient. The activated CTLs can be used for treating cancers, immune disorders, vital infections, AIDS, hepatitis, bacterial infection, fungal infection,

Uptake of agonist mannosylated peptides will increase the T cell response, whereas uptake of antagonist peptides blocks the T cell response. Blocking binding of immunogenic autoantigens can be used in treatment of type I diabetes, rheumatoid arthritis, graft rejection etc., also to induce T-cell non-responseiveness. Vaccines containing mannosylated antigen are used to response to the foreign by a parterial virtues of the foreign by

It is characterised in that it comprises at least a part of the following sequence, where the amino acid at position 2 or 8 is substituted: Lys-Thr-Trp-Gly-Gln-Tyr-Trp-Gln-Val. Vaccines comprising the peptide, an epitope of the peptide, mucleotide sequence encoding the peptide, or an antigen presenting cell preloaded with the peptide or antibody as above, are useful for cancer, particularly melanoma, treatment. The peptides can also be used to generate antigen reactive cumour infiltrating lymphocytes, which can also be used in vaccines. The peptides can be exploited to elicit native epitope-reactive CTL. Usage of the peptides with improved immunogenicity may contribute to the development of CTL-epitope based vaccines in viral disease and cancer.

It is characterised in that it comprises at least a part of the following sequence, where the amino acid at position 2 or 8 is substituted: Lys-Thr-Try-Gly-Gln-Tyr-Try-Gln-Val. Vaccines comprising the peptide, an epitope of the peptide, nucleotide sequence encoding the peptide, or an antigen presenting cell preloaded with the peptide or antibody as above, are useful for cancer, particularly melanoma, treatment. The peptides can also be used to generate antigen reactive tumour infiltrating lymphocytes, which can also be used in vaccines. The peptides can be exploited to elicit native epitope-reactive CTL. Usage of the peptides with improved immunogenicity may contribute to the development of CTL-epitope based vaccines in viral disease and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                Human; sdph3.10; SAGE; sdp3.8; HAGE; sdp3.5; TRAP; sarcoma; tumour rejection antigen precursor; tumour associated nucleic acid; carcinoma; cancer; immune response; diagnosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   complexes are used for treating cancer, especially sarcoma and carcinoma, in humans and other animals. Compositions containing autologous cytolytic T cells (CTL), specific for the HLA/(I) complex, are similarly useful, also transformed cells that stimulate such CTL in vivo. (II) are also used: (i) as source of therapeutic antisense sequences that reduce expression of (II); (ii) for recombinant production of (I); (iii) particularly its fragments, as primers and production of (I); (iii) particularly its fragments, as primers and prophes in usual hybridisation and amplification assays, for diagnosis, prognosis and monitoring of tumours, or for measuring binding specificity of HLA molecules or CTL clones; (iv) to identify related sequences; and (v) for generating transgenic animals, e.g. for studying cancer and immune responses to it. (I) are used to raise specific antibodies (Ab) and therapeutically. Ab are used to diagnose tumours in immunoassays, also for delivering drugs, toxins, imaging agents etc. to (I)-expressing cells. ANY49637 to ANY49670 represent exemplary tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
```

밁 Ş

The invention relates to the generation of a lipopeptide comprising at least one auxiliary T epitope, at least one cytotoxic T lymphocyte (CTI epitope and at least one lipid residue with (i) the epitopes and lipid portion and (ii) the epitopes, being separated independently by peptide

peptide

CC AAY45390 to AAY48214 represent specifically claimed immunogenic peptides CC having a human major histocompatibility complex (MHC) Class I (also CC known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell cresponse against the antigen from which the peptide is derived. CC cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are CC cormally induced by an antigen in the form of a peptide fragment bound CC to a HLA molecule, rather than the intact foreign antigen itself, and CC are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat CC or prevent viral infections and cancers in mammals (especially humans) CC e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. CC They can be administered as vaccines to elicit an immune response in CC individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               overall electrical charge in neutral media to ensure that the lipopeptide is hydrophilic. The peptides AAY53301-Y53549 represents examples of peptide epitopes used to generate the lipopeptides. These are used in therapeutic or prophylactic compositions and vaccines to induce specific immune responses against human immunodeficiency, hepatitis B or papilloma viruses, p53 of melanoma or the malaria parasite.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immune response; T cell activation; major histocompatibility comp

                  heterologous protein into a eukaryotic cell, comprising contacting the cell with a Y1 transformed with the above vector (Y1-EV1), (5) a method for inducing an immune response specific for a heterologous protein; (6) a method for inducing a cytotoxic T-lymphocyte (CTL) response specific for a heterologous protein; (7) a method for determining the efficacy of an antigen vaccination regimen in a subject. Y1 is used to treat a pathological disorder, by providing recombinant Yersinia for the safe delivery of proteins into eukaryotic cells. AAY33147-Y33178 are
                                                                                                                                                                                                                 enterocolitica yopEHOMP or Yersinia pseudotuberculosis yopEHAOJ; (2) an expression vector (EVI) for delivering a heterologous protein into a eukaryotic cell, comprising in the 5'-3' direction; (3) a Yersinia or mutant Yersinia strain for delivering a heterologous protein into a eukaryotic cell, comprising contacting the cell with a Y1 transformed with the above vector (Y1-EVI); (4) a method for delivering a with the above vector (Y1-EVI); (4) a method for delivering a with the above vector (Y1-EVI); (4) a method for delivering a method for delivering a with the above vector (Y1-EVI); (4) a method for delivering a with the above vector (Y1-EVI); (4) a method for delivering a method for delivering a with the above vector (Y1-EVI); (4) a method for delivering a metho
                                                                                                                                                                                                                                                                                                                                                                           mutation(s) in effector-encoding gene(s) and deficient in the proof functional effector protein(s). The invention describes (1) a quintuple mutant Yersinia strain, having the designation Yersinia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; protein delivery; Yersinia sp.; effector gene; mutant; antigen; immune response; cytotoxic T-lymphocyte; CTL; vaccination; treatment; pathological disorder; gp100-Pmell17.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel mutant Yersinia (Y1) strain,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New mutant Yersinia strains useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                             lipopeptide mimics the activity of IFNg. Compositions comprising the lipopeptide are used to treat or prevent any condition that responds to IFNg, and as adjuvant for vaccines (particularly those directed against tumors, viral or parasitic infections), to stimulate or (re)orient the immune response between types 1 and 2 cytokine profiles. Particular applications are treatment of infections (particularly viral, e.g. acquired immune deficiency syndrome, papilloma (cancer) and heparities, but also bacterial, fungal, parasitic or helminth); cancers (particularly of kidney, cutaneous T cells or ovary, chronic myelogenous leukemia or mesothelioma), allergy; and autoimmune
                                                                                                                                                                                                                                                                                                                                                                                  ANY40123-Y40379 represent epitopes that are able to activate cytotoxic T lymphocytes (CD8+ epitopes), T helper cells (CD4+ epitopes), om B epitopes recognized by corresponding antibodies. The epitopes may be used in the composition of the invention. The specification describes a lipopeptide that has a peptide part derived from mammalian interferon gamma (IFNg) and one or more lipophilic parts comprising a linear or branched, (un) saturated 4-20C hydrogarbyl chain or a steroid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Best Local
                                                                                                                                                                                                       microaggregates for inducing an immune response comprise: (a) a first lipopeptide comprising at least one CTL (cytotoxic T-lymphocyte) epitope and at least one lipid unit; and (b) a second lipopeptide comprising at least one HTL (helper T-lymphocyte) epitope and at least one lipid unit different from that of the first lipopeptide. This peptide represents an example of a lipopeptide epitope used in the invention and is derived from a human melanoma protein. The immunogenic lipopeptide micelles are used in vaccines, especially against HIV, hepatitis B virus (HBV), papilloma viruses, p53, melanoma or Plasmodium falciparum malaria.

The specification describes a MAGE-3 tumour associated gene. Peptides (AAY01721-25) that bind human leucocyte antigen (HLA) Class II molecules can be derived from the MAGE-3 protein. These peptides and autologous CD4+ cells that bind to a complex of MAGE-3 peptide and HLA Class II, are used to treat MAGE-3 related disease, particularly cancers (e.g. melanoma, osteosarcoma, leukemia and particularly cancers (e.g. melanoma, osteosarcoma, leukemia and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MAGE-3; tumour associated gene; human leucocyte antigen Class II; autologous CD4+ cell; MAGE-3 related disease; cancer; melanoma; osteosarcoma; leukemia; carcinoma.
                        leukocyte antigen-presenting molecule; allograft rejection.
                                                                                                                                                                                                                                                                                                                                                                                                      various forms of carcinoma). The peptides are also used to produce specific antibodies. Detection of of the peptides, e.g. in binding assays, particularly with antibodies, is used for diagnosis of such

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (A) inducing an immune response by: (i) administering a virus containing a nucleic acid molecule encoding the antigen or its precursor to generate an immune response; and (ii) administering at least one booster dose comprising a peptide including the antigen, in an adjuvant, in a combined amount effective to enhance the initial immune response; or (B) reducing an immune response as defined for (A) but using a non-adjuvant with the peptide which includes the antigen, in an amount effective to reduce the initial immune response. Method (A) is used to enhance the immune response against tumour cells expressing tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    rejection antigens, and against pathogens in subjects having human leukocyte antigen-presenting molecules. Method (B) is used to reduce the immune response in allergy, autoimmune disease, and allograft rejection. Method (A) provides an immunisation method which, unlike prior art, is not limited by the host immune response against viral vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunization methods using viruses expressing antigen for priming and booster immunizations - useful for modulating immune responses against antigen, e.g. enhancing immune response against tumour cell expressing tumour rejection antigens

The method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen, an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of disease such as cancer, e.g. malignant melanoma or infectious disease, e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes place in the milieu of the lymphoid organ, and it sustains stimulation that is necessary to keep CTL active, cytotoxic and recirculating through the body. AAV10071 to AAV10639 represent examples of peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to microparticles which are less than microns in diameter, which comprise a polymeric matrix, a lipid and nucleic acid molecule. The microparticle is specifically not encapsulated in a liposome and does not comprise a cell. The nucleot sequence encodes an expression product that binds to major histocompatibility complex (MHC) type I or II molecules. Peptides AAB33602-B33647 represent MHC class II associated immunogenic paptid and AAB33648-B33710 represent MHC class I associated immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         peptides. The peptides are examples of the expression products of the nucleotide sequences which can be included in the microparticles of the invention. Sequences AAB33711-B33716 represent alternative expression products and nuclear localisation signals also used in the invention microparticles are useful for administering a nucleic acid into the mucosal tissue preferably vaginal tissue of an animal.
Claim 7;
                                              Fused protein capable of inducing cellular immune response, vactive ingredient for drug compositions in preventing and/or infectious diseases such as malaria or cancer -

                                                   AAB08668-B08704 represent antigenic peptides characteristic of tumours. The peptides may be combined in vaccines with a human EphA3 HLA (human leukoyte antigen) class II-binding peptide. EphA3 antigens, when presented by an antigen presenting cell having a HLA class II molecule, effectively induce activation and proliferation of CD4+T lymphocytes. EphA3 is a tumour associated gene. EphA3 HLA binding peptides are used for selectively enriching a population of T lymphocytes. The peptides are also used for diagnosing a disorder characterized by EphA3 or EphA3 HLA binding peptide expression. The peptides are also used to treat a disorder characterized by EphA3 expression. The EphA3 binding peptides are also used to treat a disorder characterized by EphA3 or EphA3 are useful in producing vaccines and antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            shock protein. Also described are: (1) a drug composition containing (1) as active ingredient; (2) a DNA encoding (1); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (1) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a specifically claimed CTL epitope for use in a fused protein of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel tyrosine kinase receptor, EphA3 human leukocyte antigen (HLA) class II binding peptide and nucleic acid encoding the receptor, us for diagnosing and treating conditions characterized by expression of the conditions characterized by expression of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  22-FEB-1999;

                                                                                                                                               decapeptide sequences, that function as tumour rejection antigens (TRAS). These peptides are capable of forming a complex with major histocompatibility complex (MHC) molecule type HLA-A2.1 (Human Leucocyte Antigen), that are recognised by T-lymphocytes and elicit an immune response from cytolytic T-lymphocytes (CTL). They function as an immune response stimulator. Tumour rejection antigens are useful in prophylaxis, therapy and diagnosis of tumours and are effective in controlling or preventing tumour growth. The present sequence is the human gpl00 Pmell17 nonapeptide-1, that corresponds to residues 154-162 of the tumour associated gene, gpl00 Pmell17 encoding protein. It can be administered to induce or enhance an immune response and is presented by HLA-A2 complex. This peptide can serve as a tumour rejection antigen (TRA) and in combination with adjuvants, can produce vaccines useful for treating a variety of figures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gp100 Pmel117; human; Tumour Rejection Antigen; TRA; tumour; cancer; HLA; Human Leucocyte Antigen; MHC; Major Histocompatibility Complex; CTL; cytolytic Tlymphocyte; immune response stimulator; prophylaxis; therapy; diagnosis; TNF; tumour necrosis factor; vaccine; cytostatic.

                                                                                                                                                                                                                                                                                                                                                                                                                preferably in humans, but also in non-human animals to generated immune components which can then be used to treat humans or diagnostically. Therapeutically, the peptides are useful in generation of cytolytic T cells either in vitro or in vivo which specifically lyse pathogenic cells. The peptides can also be used to identify HLA-B35 positive cells, or to remove HLA-B25 positive cells from mixtures containing such cells. Nucleic acid molecules end to the peptides can be used inter alia as probes to identify cells which are expressing tyrosinase. The present sequence represents an HLA binding peptide used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes isolated peptides which bind to human leukocyte antigen (HLA)-B35 molecules leading to recognition and lysis of the resulting complexes by cytolytic T cells. The isolated peptides are sometimes derived from tyrosinase. Compositions comprising the peptides of the invention can be used to generate immune responses,

                                                                                                                        A novel method of isolation of cytotoxic T-lymphocytes (CTL) clones comprises successive steps of stimulation and testing of lymphocytes with antigen presenting cells (APCs) which present antigens derived from different expression systems. The CTL clones isolated recognize specific antigenic peptides of proteins, preferably of the MAGE family. The APC is autologous and each expression systems is different from at least one of the other expression systems, therefore isolating a cytotoxic T cell clone specific for the protein. The method can also be used to identify an antigenic peptide epitope. Isolated CTL clones specific for a peptide/human leukocyte antigen (HLA) complex are claimed. The complexes on the cell surface are useful for treating pathological conditions characterized by abnormal expression of the complexes.
                                                                                                                                                                                                                                                                                                                                                                                                                Stroobant V, Cornelis GR, Schultz E, Warnier G.

 ween the Swiss Institute of Bioinf
European Bioinformatics Institute.
 SIMILARITY: BELONGS TO THE PMEL-17 SIMILARITY: Contains 1 PKD domain.
 IS ALSO A SECRETED SO PROTEOLYTIC CLEAVAGE. TISSUE SPECIFICITY: P
 SUBCELLULAR LOCATION: TYPE IS ALSO A SECRETED SOLUBLE
 FUNCTION: COULD BE A MELANOGENIC ENZYME. COULD REPRESENT AN ONCOPETAL SELF-ANTIGEN THAT IS NORMALLY EXPRESSED AT LOW LEVELS QUIESCENT ADULT MELANOCYTES BUT OVEREXPRESSED BY PROLIPERATING NEONATAL MELANOCYTES AND DURING TUMOR GROWTH. RELEASE OF THE SOLUBLE FORM, MEZO-S, COULD PROTECT TUMOR CELLS FROM ANTIBODY MEDIATED IMMUNITY.
 TISSUE SPECIFICITY: PREFERENTIALLY EXPRESSION WAS FOUND IN DYSPLASTIC TISSUES NOR IN CARCINOMAS.

English LANGUAGE:

The use of reverse immunol. may be necessary to identify new tumor-assocd. antigens, particularly for cancers, against which tumor-reactive T cell populations have been difficult to establish. One approach has been to screen peptides derived from a candidate antigen with high major histocompatibility complex (MHC) binding affinities for the induction of tumor-reactive T lymphocytes in vitro. However, many candidate antigens that are overexpressed in tumors are non-mutated self-proteins, and unlike foreign or mutated proteins, immunodominant epitopes may not be expressed at high d. on the surface of tumor cells. Therefore, to identify tumor-assocd. epitopes, it may be necessary to screen large panels of peptides with wide ranges of MHC binding affinities. The current methodol. of stimulating peripheral blood lymphocytes (PBL) from donors expressing the MHC mol. of interest with individual peptides is impractical for screening such large panels. Therefore, the authors evaluated the use of mixts. of peptides with variable MHC binding affinities for the induction of tumor-reactive T lymphocytes with the melanoma antigens gp100 and an alternate isoform of tyrosinase-related protein 2 (TRP2-6b) as models. A mixt. of 10 known human leukocyte antigen (HLA)-A\*0201-restricted peptides from gp100 induced melanoma-reactive cytotoxic T lymphocyte (CTL) from multiple patients with metastatic melanoma. The majority of these T cell populations recognized the known immunodominant epitopes qp100:209-217 and qp100:280-288, even though the HLA-A\*0201 binding affinities of these peptides were much lower than other peptides in the mixt. Similarly, melanoma-reactive CTL were generated with a mixt. of HLA-A\*0201-restricted peptides from TRP2-6b, and these responses were directed against the previously identified tumor-assocd. epitopes TRP2-6b:180-188, TRP2-6b:288-296 and TRP2-6b:403-411. Thus, the use of peptide mixts. may facilitate the identification of new tumor-assocd. antigens through the application

 Described herein are genes whose expression are up-regulated or
ΑB
 down-regulated in specific cancers, including acute lymphocytic
 leukemia, glioblastoma, glioblastoma multiforme, glioma, kidney
 cancer, stomach cancer, melanoma, and benign NEVI. Mol. profiles of
 various normal and cancerous tissues were detd. and analyzed using
 the Affymetrix/Eos Hu01 and Hu03 GeneChip microarrays contg. 35,403
 and 59,680 probe sets, resp. Related methods and compns. that can
 be used for diagnosis and treatment of those cancers are disclosed.
 Also described herein are methods that can be used to identify
 modulators of selected cancers.

 503636-92-8
 RL: ANT (Analyte); DGN (Diagnostic use); PRP (Properties); THU
 (Therapeutic use); ANST (Analytical study); BIOL (Biological study);
 USES (Uses)
 (amino acid sequence; gene expression profiles useful in methods
 of diagnosis of cancer compns. and methods of screening
 for modulators of cancer)

AB The authors disclose a method for generation of cytotoxic T lymphocyte (CTL) clones. These CTL comprise clones that have been isolated by successive steps of stimulation and testing with different antigen presenting cells; these cells utilize various expression systems (e.g., from recombinant Yersinia, recombinant Salmonella, or recombinant viruses) for presentation of cognate antigen by HLA class I complexes. In particular, the present invention relates to isolated CTL clones that are specific for MAGE-1 and MAGE-4.

TITLE:

Priming of T cells with Ad-transduced DC followed by expansion with peptide-pulsed DC significantly enhances the induction of

tumor-specific CD8+ T cells: implications for an

efficient vaccination strategy

In recent years, vaccination strategies using antigen-presenting AB cells (APC) have been under investigation. Antigen delivery using genetic immunization through ex vivo transduction of dendritic cells (DC) is supposed to enhance the induction of antitumor responses in humans by activating a broad range of peptide-specific CD8+ T cells. In this study, we compared the potential of adenoviral (Ad)-transduced vs. peptide-pulsed DC to induce melanoma-antigen (Ag)-specific T-cell responses in vitro. Whereas gp100-peptide-pulsed DC induced long-lasting specific CD8+ T-cell. responses against single peptides, Ad-transduced DC induced broad and strong, specific immunity against various peptides of the gp100-Ag. Surprisingly, several restimulations led to decreasing qp100-specific and in parallel to increasing anti-adenoviral T-cell responses. Nevertheless, those anti-adenoviral T-cell responses provided an adjuvant' effect by inducing an early release of high amts. of IL-2/IFN-.gamma., therewith enhancing CTL induction in the initiation phase. Based on these data, we suggest a prime/boost vaccination strategy in melanoma patients - combining the use of Ad-DC and peptide-pulsed DC - to obtain efficient and long-term antitumor T-cell responses.

AB The present invention provides epitopes that have a high affinity for MHC class I, and that correspond to the processing specificity of the housekeeping proteasome, which is active in peripheral cells. These epitopes thus correspond to those presented on target cells, and are derived from tumor-assocd. antigens such as tyrosinase,

SSX-2, PMSA (prostate-specific membrane antigen), GP100, MAGE-1, MAGE-2, MAGE-3, NY-ESO-1, PRAME (also known as MAPE, DAGE, and OIP4), PSA (prostate-specific antigen), and PSCA (prostate stem cell antigen). The use of such epitopes in vaccines can activate the cellular immune response to recognize the correctly processed tumor-assocd. antigen and can result in removal of target cells that present such epitopes. The housekeeping epitopes provided can be used in combination with immune epitopes, generating a cellular immune response that is competent to attack target cells both before and after interferon induction. The epitopes are also useful in diagnosis and monitoring of the target-assocd. disease and in the generation of immunol. reagents for such purposes. Disclosed herein are polypeptides, including epitopes, clusters, and antigens.

TITLE: Modification of a tumor-derived peptide at an

HLA-A2 anchor residue can alter the conformation

of the MHC-peptide complex: probing with

TCR-like recombinant antibodies

A common assumption about peptide binding to the class I MHC complex is that each residue in the peptide binds independently. Based on this assumption, modifications in class I MHC anchor positions were used to improve the binding properties of low-affinity peptides (termed altered peptide ligands), esp. in the case when tumor-assocd. peptides are used for immunotherapy. Using a new mol. tool in the form of recombinant Abs endowed with Ag-specific MHC-restricted specificity of T cells, the authors show that changes in the identity of anchor residues may have significant effects, such as altering the conformation of the peptide-MHC complex, and as a consequence, may affect the TCR-contacting residues. The authors herein demonstrate that the binding of TCR-like recombinant Abs, specific for the melanoma differentiation Ag T cell epitope G9-209, is entirely dependent on the identity of a single peptide anchor residue at position 2. An example is shown in which TCR-like Abs can recognize the specific complex only when a modified peptide, G9-209-2 M, with improved affinity to HLA-A2 was used, but not with the unmodified natural peptide. Importantly, these results demonstrate, using a novel mol. tool, that modifications at anchor residues can dramatically influence the conformation of the MHC peptide groove and thus may have a profound effect on TCR interactions. Moreover, these results may have important implications in designing modifications in peptides for cancer

```
immunotherapy, because most such peptides studied are of low
 affinity.

 Disclosed herein are polypeptides, including epitopes, clusters, and
AΒ
 antigens. Also disclosed are compns. that include said polypeptides
 and methods for their use for cancer diagnosis and therapy.

PRIORITY APPLN. INFO.:
 T cell responses are often diminished in humans with a compromised
 immune system. We have developed a method to isolate, stimulate and
 expand naive cytotoxic T lymphocyte precursors (CTLp) to
 antigen-specific effectors, capable of lysing tumor cells in vivo.
 This ex vivo protocol produces fully functional effectors.
 Artificial antigen presenting cells (AAPCs; Drosophila melanogaster)
 transfected with human HLA class I and defined accessory mols., are
 used to stimulate CD8+ T cells from both normal donors and cancer
 patients. The class I mols. expressed to a high d. on the surface
 of the Drosophila cells are empty, allowing for efficient loading of
 multiple peptides that results in the generation of polyclonal
 responses recognizing tumor cells endogenously expressing the
 specific peptides. The responses generated are robust,
 antigen-specific and reproducible if the peptide epitope is a
 defined immunogen. This artificial antigen expression system can be
 adapted to treat most cancers in a significant majority of the
 population.

NS1-Mela 1 and NS1-Mela 2, carrying, resp. two HLA-A2 epitopes derived from human melanoma antigens were constructed and their capability to induce CTL responses in vivo were studied in HLA-A2 transgenic mice. Strong CTL responses specific for GnT-V/NA 17-A and gp100 (154-162) epitopes were generated in HLA-A2 transgenic mice immunized by the construct NS1-Mela 1 carrying these two epitopes. The second construct NS1-Mela 2 carrying both Tyrosinase (369-377 Da) and Melan-A/Mart-1 (27-35) epitopes induced a weak Tyrosinase-specific CTL response in mice but failed to induce specific CTL responses against the Melan-A/Mart-1 (27-35) epitope in the tested mice. Thus, recombinant tubular structures contg. multiple tumoral epitopes may lead to new strategies for the induction of strong tumor-specific CTL responses in cancer patients. 162558-08-9

WO 2001-GB4844 W 20011101

The present invention relates to polynucleotides for use in cancer therapy. In particular, the invention provides a polynucleotide capable of expressing an epitope-.beta.2m fusion protein; for use in the generation of cytotoxic T lymphocyte (CTL) responses against a tumor; and a polynucleotide capable of expressing an epitope-.beta.2m fusion protein; for use in a method of restoring antigen presentation in the tumor of a host. The epitope is derived from latent membrane protein, EBNA-3C antigen, BZLF1 or BMLF1 of Epstein-Barr virus; lower matrix protein pp65 of cytomegalovirus; nucleoprotein or matrix protein of influenza; and tumor antigens of human.

Purpose: To assess the therapeutic potential of a melanoma polyepitope vaccine in human cells. Polyepitope DNA vaccines encoding T-cell epitopes have been demonstrated in murine systems to generate multiple cytotoxic T-cell responses to different antigens. Here, for the first time the authors demonstrate the ability of a melanoma polyepitope to stimulate lymphocytes from normal human donors to simultaneously generate multiple antigen-specific responses. Exptl. Design: Human dendritic cells (DC), transduced with a melanoma-polyepitope cDNA, were used to activate autologous lymphocytes from naive donors as an in vitro model of DNA vaccination. Lymphocytes were primed with polyepitope or mock-transduced DC, boosted with peptide, then measured for antigen-specific cytotoxicity. Results: Lymphocytes primed with polyepitope-transduced DC and boosted with peptide generated multiple cytotoxic responses. By contrast lymphocytes primed with mock-transfected DCs and boosted with peptide gave no specific cytotoxicity. However, when lymphocytes were repeatedly stimulated with polyepitope-transduced DCs immunodominance was seen with CTLs being generated to only one epitope, MART27-35. Conclusions: the authors show in a human system that a melanoma polyepitope primes CTL to multiple epitopes. However, repeated stimulation by the polyepitope restricts the response to only the MART1 epitope. Thus,

although polyepitope vaccines are an effective way of priming multiple naive T-cell responses, continual boosting with polyepitope vaccines may, as a result of immunodominance, restrict the CTL. These findings have important implications for the use of DNA polyepitope vaccines in cancer immunotherapy.

 The present invention relates to immunotherapeutic compns.
AB
 comprising an effective amt. of a mol. chaperone such as a heat
 shock protein, preferably hsp70, non-covalently bound to one or more
 javelinized melanoma antigens and to methods of using the
 immunotherapeutic compns. to induce an immune response against
 melanoma in a subject. The immunotherapeutic compn. may contain one
 or more heat shock proteins, such as one or more of hsp70, hsp90,
 gp96, BiP, and hsp40, and may contain one or more javelinized
 melanoma antigens.

WO 2001-US8919 W 20010319

The present invention provides synthetic compds., antibodies that recognize and bind to these compds., polynucleotides that encode these compds., and immune effector cells raised in response to presentation of these epitopes. In particular, this invention provides novel, synthetic antigenic peptide sequences, which are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for cancers characterized by expression of the melanoma antigen gp100. The invention further provides methods for inducing an immune response and administering immunotherapy to a subject by delivering the compns. of the invention. In one embodiment, the altered ligands of the invention have comparable affinity for MHC binding as the native ligand.

IT 155422-80-3

RL: PRP (Properties)

(unclaimed protein sequence; synthetic antigenic peptide sequences for gp100 pos. melanoma and uses for cancer vaccines)

Blood lymphocytes from HLA-A\*0201-subtyped melanoma patients and healthy controls were screened for the presence of T cells specific for HLA-A\*0201-binding melanoma and viral peptide antigens by the enzyme-linked immunoSPOT (ELISPOT) assay. CD8+ cells were tested for peptide-specific IFN-.gamma. release immediately after selection as well as after 2 wk of in vitro stimulation. After in vitro stimulation, CD8+ T cells specific for influenza were measured in all patients and controls, whereas these T cells could be detected among nonstimulated CD8+ cells in only 52% of individuals. Similarly, T cells specific for EBV were more frequently measured among in vitro-stimulated than nonstimulated CD8+ cells. In nonstimulated CD8+ cells, T cells specific for MART-1/Melan-A, gp100, tyrosinase and CAMEL were present in 4 (33%), 1 (8%), 1 (8%) and 3 (25%) of 12 patients, resp. Only MART-1/Melan-A-specific CD8+ T cells were found in 1 (11%) of 9 healthy controls. CD8+ T cells specific for MAGE-2 were not obsd. After in vitro stimulation, CD8+ T cells specific for MART-1/Melan-A could be demonstrated in 6 (46%) of 13 patients and 2 (20%) of 10 controls. CD8+ T cells specific for gp100 were detected in 1 patient after in vitro stimulation. No CD8+ T cells specific for tyrosinase, MAGE-2 or CAMEL could be measured after in vitro stimulation. These data show that the ELISPOT assay allows direct ex vivo detection of CD8+ T cells specific for viral and melanoma antigens. Furthermore, the data show that the sensitivity of the ELISPOT assay to measure influenzaand EBV-specific CD8+ T cells can be enhanced by a short in vitro stimulation step, whereas opposing effects on nos. of CD8+ T cells specific for melanoma antigens have been obsd.

The invention provides the cDNA and deduced protein sequence of tumer assocd. gene sdp3.8 (HEGA) from human sarcoma cell line LB-23. The sdp3.8 gene is expressed in normal testis tissue and several tumoral cells. This invention also provides the the predicted HLA binding motifs in HAGE(sdp3.8) peptides and the gene bank search results of HAGE (sdp3.8) sequence homologs. Methods and products also are provided for diagnosing and treating conditions characterized by expression of a sdp3.8 gene product.

been quite successful with synthetic peptides used as immunogens. Gp100 is a human melanoma-assocd. antigen (hgp100) with a highly homologous mouse counterpart, pmel17/gp100 (mgp100), that is expressed in melanocytes and highly tumorigenic B16 melanoma cells. Since mgp100 is poorly immunogenic in mice, we used a xenoimmunization approach and vaccinated with the hgp100 immunogen. To that end, plasmid DNA encoding hgp100 was applied as a vaccine in combination with three synthetic peptides corresponding to putative cytotoxic T cell epitopes of hgp100. Immunization with DNA and peptide-pulsed spleen cells had a synergistic effect and provided significant protection against a challenge with poorly immunogenic B16-F0 malignant melanoma cells in the syngeneic C57BL/6 mouse Vaccination with either plasmid DNA or peptides alone delayed the onset of tumor formation, and reduced tumor growth 2-fold and 30-fold, resp. However, while all animals vaccinated with DNA encoding hgp100 or with peptides eventually developed tumors, 30% of the animals treated with both vaccines remained tumor free and survived for the entire observation period of 150 days. Depletion of T cell subsets revealed that the protective effect obsd. after vaccination with plasmid DNA was mediated by CD4+ and CD8+ T cells, while protection following vaccination with DNA encoding hgp100 in combination with peptides appears to depend on CD4+ T cells only. Furthermore, we could also demonstrate a therapeutic effect of the combined DNA/peptide regime. A single treatment cycle consisting of injections of plasmid DNA and peptide-pulsed spleen cells led to a fourfold redn. in the growth rate of preexisting tumors. The data presented demonstrate that immunization with xenoantigens induces cross-species priming leading to an immunol. response against the tumor-specific antigens.

#### IT 162558-08-9

RL: THU (Therapeutic use); BIOL (Biological study); USES (Uses) (combined DNA and peptide vaccine against gp100 in a malignant

melanoma)

 An improved method of inducing and/or enhancing an immune response
 to a tumor antigen is disclosed. The method involves administering
 the tumor antigen, nucleic acid coding therefor, vectors and/or
 cells comprising said nucleic acid, or vaccines comprising the
 aforementioned to a lymphatic site.

AB Polyepitope proteins comprising an hepatitis B preS2 antigen into which is inserted epitopes of viral, fungal, bacterial or tumor antigens are disclosed. Also disclosed are nucleotide sequences encoding such hybrid proteins, vectors contg. these sequences, and the use of the polyepitope proteins or nucleotide sequences encoding them for induction of CTL responses. H-2 class I neg., HLA-A2.1 transgenic HHD mice were used for a comparative evaluation of the immunogenicity of HLA-A2.1 restricted human tumor-assocd. CTL epitopes and HIV 1-derived epitopes. A hierarchy was established among these epitopic peptides injected into mice in IFA which correlates globally with their capacity to bind and stabilize HLA-A2.1 mols. A tyrosine substitution in position 1 of the HIV 1-derived epitopic peptides, which increases both their affinity for and their HLA-A2.1 mol. stabilizing capacity, was introduced in a significant proportion of them. DNA immunizations were performed using a construct comprising nucleic acids encoding the epitopes inserted into the pre-S2 segment of the hepatitis B middle glycoprotein. CTL responses against most of the inserted epitopes could be elicited simultaneously in a single animal.

# IT 162558-08-9 332959-83-8

RL: PRP (Properties)

(unclaimed sequence; hepatitis B virus preS2 proteins contg. tumor or pathogen epitopes and DNA constructs encoding them for use in induction of CTL response)

PRIORITY APPLN. INFO.:
 H-2 class I neg., HLA-A2.1 transgenic HHD mice were used for a
 comparative evaluation of the immunogenicity of HLA-A2.1 restricted
 human tumor-assocd. CTL epitopes. A hierarchy was established among
 these epitopic peptides injected into mice in IFA which correlates
 globally with their capacity to bind and stabilize HLA-A2.1 mols.
 Co-injection of a helper peptide enhanced most CTL responses. In
 contrast, classical HLA class I transgenic mice which still express
 their own class I mols. did not, in most cases, develop
 H.A.-A2.1-restricted CTL responses under the same exptl. conditions.
 Different monoepitopic immunization strategies of acceptable clin.
 usage were compared in HHD mice. Recombinant Ty-virus-like
 particles, or DNA encoding epitopes fused to the hepatitis B virus
 middle envelope protein gave the best results. Using this latter
 approach and a melanoma-based polyepitope construct, CTL responses
 against five distinct epitopes could be elicited simultaneously in a
 single animal. Thus, HHD mice provide a versatile animal model for
 preclin. evaluation of peptide-based cancer immunotherapy. In
 addn., this invention provides polynucleotides contg. at least part
 of the coding sequence of the middle glycoprotein of the hepatitis B
 virus in which is inserted a DNA sequence coding for an epitope
 comprising at least one tumoral epitope of a tumor antigen.

Autologous cytolytic T lymphocyte clones are obtained from a AB melanoma patient, LB 1751, which recognize and hallow the identification of hitherto unknown HLA-A2.1-presented tumor rejection antigens encoded by MAGE-A10 and MAGE-A8. The cDNA and deduced amino acid sequences of MAGE-A10 and MAGE-A8 are provided.
